

The cohort V-axis is a 9-stimulus contrast, not a within-subject phenomenon

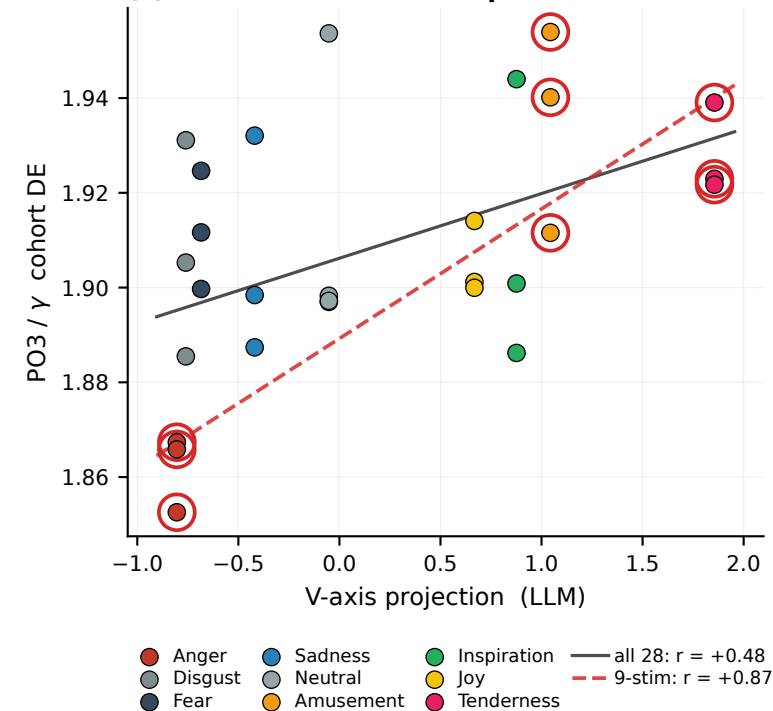

(a) Cohort r collapses without 9 pole stim

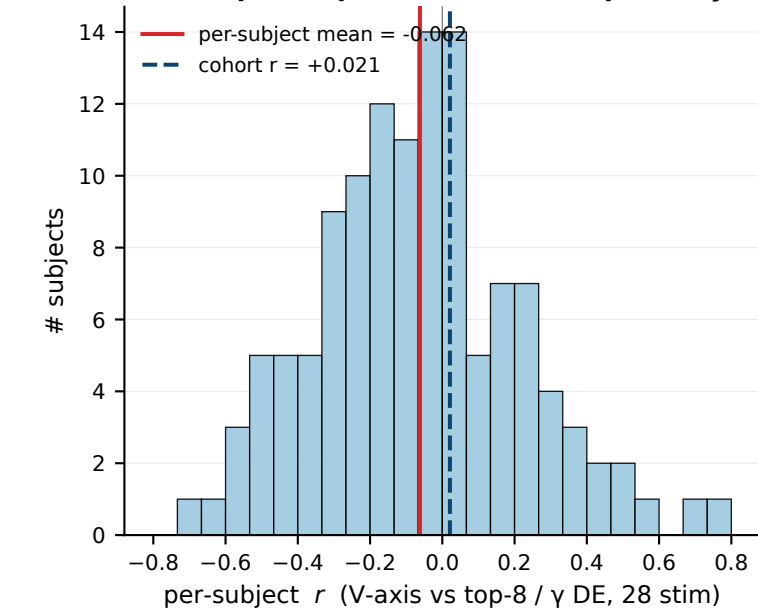

(b) Anger drives 32 % of the cohort signal

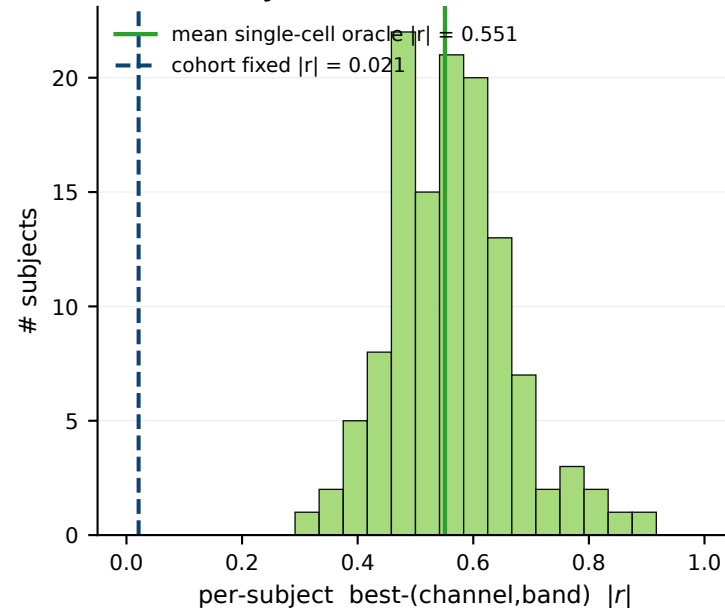

(c) Per-stim view: PO3 / γ × V-axis

(d) Simpson's paradox: cohort ≠ per-subject

(e) Per-subject oracle: 0.55 mean, 0.89 best

(f) Take-home

Cohort signal $r = +0.021$
Per-subject mean $r = -0.062$
Oracle (single cell) $|r| = 0.551$
Oracle (all-band) $|r| = 0.616$

The cohort summary HIDES large per-subject signal that lives on idiosyncratic (channel, band) cells.

Population-level claim: POSITIVE ✓
 Within-subject claim: requires per-subject channel selection
